Ice for JS Client

首先利用slice2js生成ice文件对应的js文件,在html或相应的前端页面中添加该js文件和Ice.js、Glacier2.js、IceGrid.js文件。没有Ice的js库可以到该连接下载http://cdnjs.com/libraries/ice。注意:服务端配置要添加对ws协议的支持,因为js是通过websocket实现的。registry.cfg的配置如下,多个协议要用英文字符":"分割

```
IceGrid.Registry.Client.Endpoints=tcp -p 4061:ws -p 4062
```

grid.xml的配置如下, endpoints="tcp:ws", 多个协议要用英文字符":"分割

```
<service name="TicketService" entry="com.zzwtec.iceTicketProject.ice.service.MyTicketService">
        <adapter name="TicketService" id="TicketService${id}" endpoints="tcp:ws" replica-
group="TicketServiceRep"></adapter>
        </service>
```

前端页面代码如下

```
var communicator;
var iceData = new lce.InitializationData();
Ice.Promise.try(
        function() {
          iceData.properties = Ice.createProperties();
          iceData.properties.setProperty("Ice.Default.Locator","IceGrid/Locator:ws -h 192.168.0.112 -p
4062");
          communicator = Ice.initialize(iceData);
          var proxy = communicator.stringToProxy("TicketService");
          return ticket.TicketServicePrx.checkedCast(proxy).then(
                function (ticketServicePrx) {
                        //调用
                        return ticketServicePrx.gueryMyOrders("13631276694");
          ).then(
                function (result){
                        //调用返回结果处理
                }
          );
).finally(
        //释放communicator
        function() {
          if(communicator) {
             return communicator.destroy();
          }
        }
).exception(
        //异常处理
        function(ex) {
          console.log(ex.toString());
          //process.exit(1);
        }
);
```
